

L1.6 In-class Assignment – Vectors

CPSC 292 – 9/4/2026

Name: _____ Section: _____

Collaboration team: _____

Question 1

List the left-to-right order of operations that R follows.

Question 2

Predict R's output for the following calculation:

$8/4+3-2^2$

Step through the order of operations, evaluating one operation per line to perform the calculation.

Question 3

With the vector `bark`:

```
bark <- c(8.3, 87, 1, -2.333, 103, 6)
```

predict the output of the operation:

```
sort(bark, decreasing=TRUE)
```

and explain your answer.

Question 4

You create a vector of the first 100 even numbers using:

```
first100evens <- seq(2,200, by = 2)
```

but you really only need the first 10 for your application. Write a line of code that will extract the first 10 even numbers from `first100evens`. Store it as an object named `first10evens`.

Question 5

Convert the vector:

```
vec <- c(2, 0.5, 1, 2, 0.5, 1, 2, 0.5, 1)
```

to a vector of only 1's using a vector of length 3.
