Lecture 3.8 – Documenting Your Work

Specific Learning Objectives:

2.2.2 – Include effective documentation in scripts and projects.

2.2.4 – Create and use Notebooks and documents using RMarkdown.

Standard Organization for R Projects

- **Standard organization** refers to the accepted way to organize parts of a project that helps orient users to your code.

MyProject

- ALL PARTS of the project belong in the main directory!

RProject file

- Established automatically when opening a new project

README file

- README files give instructions on how to run code to user and info about the project

data/

- directory containing all raw data (csv files)

src/

- directory containing all scripts (you might not have this)

results/

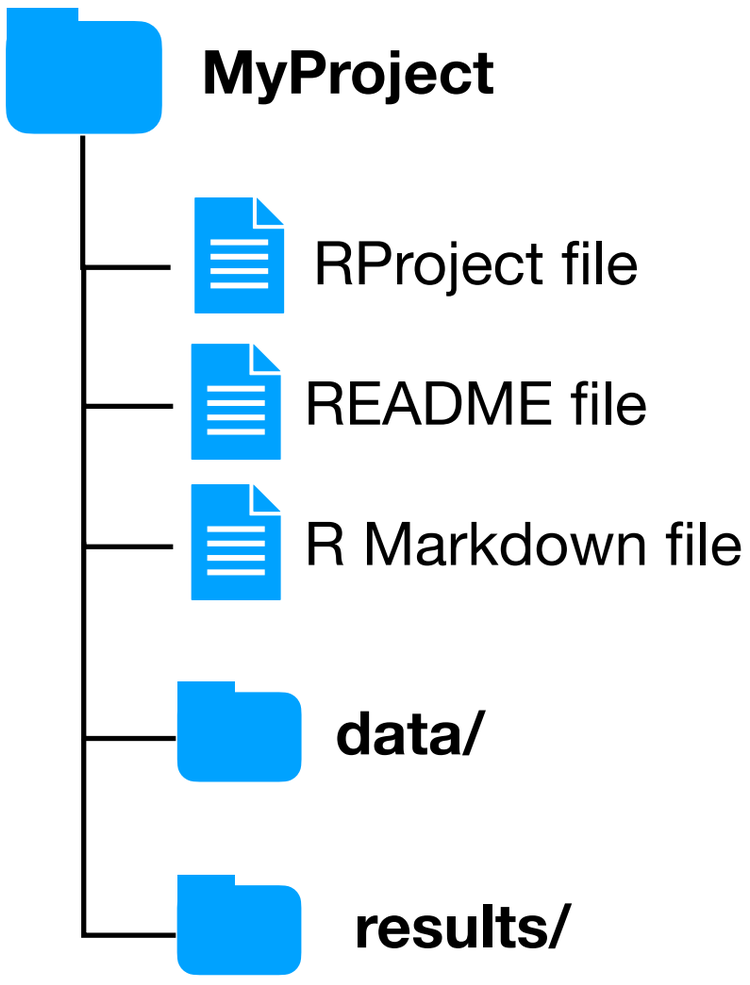
- directory containing all results produced by your code

doc/

- directory containing all documentation (including RMD files)

Standard Organization for R Projects

- **Modified standard organization** is acceptable for projects in this course!



- If you only have one R Markdown file, you can put it in the main directory. But data and results must still be separated!

In Class Exercises

1. **Take this time to reorganize your Project 2. Make it conform to standard organization (or modified standard organization).**

2. **Add some documentation to your project 2 code. It can be in-code description, function/file level descriptions, adding to a workflow and/or README.**

Action Items

1. **Complete previous assignments.**

2. **Read Davies Ch. 11 for next time.**
